Reading data files

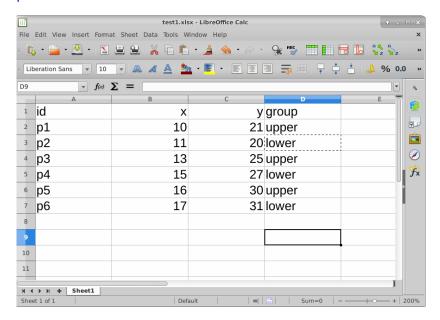

Introduction

- First thing we need to do is to read in data, so that we can use our software to analyze.
- Consider these:
 - Spreadsheet data saved as .csv file.
 - "Delimited" data such as values separated by spaces.
 - Actual Excel spreadsheets.

Packages for this section

library(tidyverse)

A spreadsheet

Save as .csv

- csv or "comma-separated values" is a way of turning spreadsheet values into plain text.
- Easy to read into R
- but does not preserve formulas. (This is a reason for doing all your calculations in your statistical software, and only having data in your spreadsheet.)
- File, Save As Text CSV (or similar).
- used name test1.csv.

The .csv file

```
id,x,y,group
p1,10,21,upper
p2,11,20,lower
p3,13,25,upper
p4,15,27,lower
p5,16,30,upper
p6,17,31,lower
```

To read this in:

- Fire up R Studio at r.datatools.utoronto.ca
- Upload this .csv file. (Bottom right, next to New Folder, Upload.) Click Choose File, find the file, click Open. Click OK. See the file appear bottom right.

Make a new Quarto document

- File, New File, Quarto Document
- ...and get rid of the template document (leaving the first four lines).
- Make a code chunk and in it put this. Run it.

library(tidyverse)

Reading in the file

Use read_csv with the name of the file, in quotes. Save the read-in file in something, here called mydata. Make a new code chunk for this:

```
mydata <- read_csv("test1.csv")
mydata</pre>
```

```
# A tibble: 6 x 4
 id
          Х
                y group
 <chr> <dbl> <dbl> <chr>
1 p1
         10
               21 upper
2 p2
        11
               20 lower
       13
3 p3
               25 upper
       15
4 p4
               27 lower
       16
5 p5
               30 upper
6 p6
         17
               31 lower
```

More on the above

- read_csv guesses what kind of thing is in each column. Here it correctly guesses that:
 - id and group are text (categorical variables). id is actually "identifier variable": identifies individuals.
 - x and y are "double": numbers that might have a decimal point in them.

R Studio on your own computer

- Put the .csv file in the same folder as your project. Then read it in as above like read_csv("test1.csv").
- Or, use

```
# f <- file.choose()
f</pre>
```

which brings up a file selector (as if you were going to find a file to load or save it). Find your .csv file, the address of which will be saved in f, and then:

```
mydata <- read_csv(f)</pre>
```

When you have selected the file, comment out the file.choose line by putting a # on the front of it. That will save you having to find the file again by mistake. (Keyboard shortcut: go to the line, type control-shift-C or Mac equivalent with Cmd.)

Looking at what we read in

Again, type the name of the thing to display it:

mydata

```
# A tibble: 6 x 4

id x y group

<chr> <dbl> <dbl> <dbl> <chr>
1 p1 10 21 upper
2 p2 11 20 lower
3 p3 13 25 upper
4 p4 15 27 lower
5 p5 16 30 upper
6 p6 17 31 lower
```

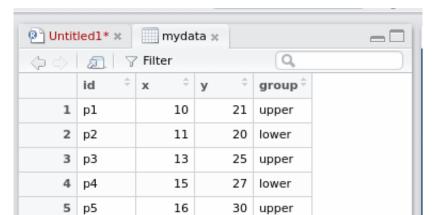

- This is a "tibble" or data frame, the standard way of storing a data set in R.
- ► Tibbles print as much as will display on the screen. If there are more rows or columns, it will say so.
- You will see navigation keys to display more rows or columns (if there are more).

View-ing your data frame

▶ Another way to examine your data frame is to View it, like this:

View(mydata)

...or find your data frame in the Global Environment top right and click it. - This pops up a "data frame viewer" top left:

This View

- Read-only: cannot edit data
- Can display data satisfying conditions: click on Filter, then:
 - lacktriangleright for a categorical variable, type name of category you want
 - for a quantitative variable, use slider to describe values you want.
- Can sort a column into ascending or descending order (click little arrows next to column name).
- Clicking the symbol with arrow on it left of Filter "pops out" View into separate (bigger) window.

Summarizing what we read in

- ▶ It is always a good idea to look at your data after you have read it in, to make sure you have believable numbers (and the right number of individuals and variables).
- Quick check for errors: these often show up as values too high or too low, so the min and/or max will be unreasonable.
- Five-number summary:

summary(mydata)

| id | X | У | gro |
|------------------|---------------|---------------|--------|
| Length:6 | Min. :10.00 | Min. :20.00 | Length |
| Class :character | 1st Qu.:11.50 | 1st Qu.:22.00 | Class |
| Mode :character | Median :14.00 | Median :26.00 | Mode |
| | Mean :13.67 | Mean :25.67 | |
| | 3rd Qu.:15.75 | 3rd Qu.:29.25 | |
| | Max. :17.00 | Max. :31.00 | |
| | | | |

- Quantitative, five-number summary plus mean.
- Categorical, how many rows.

Reading from a URL

- Any data file on the Web can be read directly.
- Example data link:
- Use URL instead of filename.
- ▶ I like to save the URL in a variable first (because URLs tend to be long), and then put that variable in the read_ function:

```
my_url <- "http://ritsokiguess.site/datafiles/global.csv"
my_url</pre>
```

```
[1] "http://ritsokiguess.site/datafiles/global.csv"
global <- read_csv(my_url)
```

The data

global

```
# A tibble: 10 x 3
   warehouse size cost
   <chr>
             <dbl> <dbl>
 1 A
               225 12.0
2 B
               350 14.1
3 A
               150 8.93
4 A
               200 11.0
5 A
               175 10.0
6 A
               180 10.1
7 B
               325 13.8
8 B
               290 13.3
9 B
               400 15
10 A
               125 7.97
```

Space-delimited files

Another common format for data is a text file with the values separated by spaces. Top of some other data:

```
cup tempdiff
Starbucks 13
Starbucks 7
Starbucks 7
Starbucks 17.5
Starbucks 10
Starbucks 15.5
Starbucks 6
Starbucks 6
SIGG 12
SIGG 16
```

SIGG 9 SIGG 23 SIGG 11 SIGG 20.5

Reading the coffee data

- This file was on my computer so I uploaded it to r.datatools.utoronto.ca first.
- ▶ This time, read_delim, and we also have to say what the thing is separating the values:

```
coffee <- read_delim("coffee.txt", " ")
coffee</pre>
```

```
# A tibble: 32 \times 2
  cup tempdiff
  <chr>
              <dbl>
1 Starbucks
               13
2 Starbucks
3 Starbucks
4 Starbucks 17.5
5 Starbucks 10
6 Starbucks 15.5
 7 Starbucks
                6
8 Starbucks
```

Looking at the values (some)

coffee

| # | A | tibble: 32 x | 2 |
|----|---|--------------|-------------|
| | | cup temp | odiff |
| | | <chr></chr> | <dbl></dbl> |
| 1 | | Starbucks | 13 |
| 2 | | Starbucks | 7 |
| 3 | | Starbucks | 7 |
| 4 | : | Starbucks | 17.5 |
| 5 | | Starbucks | 10 |
| 6 | | Starbucks | 15.5 |
| 7 | | Starbucks | 6 |
| 8 | | Starbucks | 6 |
| 9 | | SIGG | 12 |
| 10 | | SIGG | 16 |
| # | i | 22 more rows | |

These were four brands of travel mug (in cup), and for each, how much the temperature of the coffee in the mug decreased over 30

Reading from the Web; the soap data

- Use the URL in place of the filename.
- ► Save the URL in a variable first:

```
url <- url("http://ritsokiguess.site/datafiles/soap.txt")
soap <- read_delim(url, " ")</pre>
```

The soap data (some)

soap

```
# A tibble: 27 x 4
   case scrap speed line
  <dbl> <dbl> <dbl> <chr>
         218
               100 a
      1
2
      2 248 125 a
      3 360 220 a
3
4
      4 351 205 a
5
      5 470 300 a
6
      6 394 255 a
      7
         332 225 a
8
      8
         321
               175 a
9
      9
         410 270 a
         260
10
     10
               170 a
   17 more rows
```

Data aligned in columns

▶ Sometimes you see data aligned in columns, thus:

| DrugA | DrugB | DrugC |
|-------|-------|-------|
| 4 | 6 | 6 |
| 5 | 8 | 7 |
| 4 | 4 | 6 |
| 3 | 5 | 6 |
| 2 | 4 | 7 |
| 4 | 6 | 5 |
| 3 | 5 | 6 |

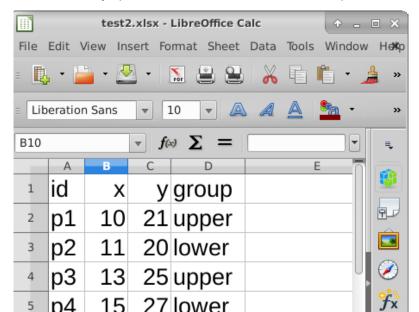

Reading in column-aligned data

```
drugs <- read_table("migraine.txt")
drugs</pre>
```

```
# A tibble: 9 x 3
  DrugA DrugB DrugC
  <dbl> <dbl> <dbl>
      4
            6
2
      5
            8
3
            4
                   6
            5
4
                   6
5
      2
            4
            6
6
                   5
            5
                   6
8
      4
           10
                   5
                   5
9
      4
            6
```

Reading an Excel sheet directly

▶ Here is my spreadsheet from before, but tarted up a bit:

Reading it in

- Read into R, saying that we only want the sheet "data". Upload spreadsheet first.
- Excel spreadsheets must be "local": cannot read one in from a URL.

```
library(readxl)
mydata2 <- read_excel("test2.xlsx", sheet = "data")
mydata2</pre>
```

```
# A tibble: 6 x 4
 id
      X
               y group
 <chr> <dbl> <dbl> <chr>
      10 21 upper
1 p1
2 p2
      11 20 lower
3 p3
      13 25 upper
      15 27 lower
4 p4
      16
5 p5
              30 upper
         17
6 p6
              31 lower
```
