Dates and times

Dates and times

Section 1

Dates and times

Dates and Times

Section 2

Dates and Times

Packages for this section

```
library(tidyverse)
library(lubridate)
```

Dates

 Dates represented on computers as "days since an origin", typically Jan 1, 1970, with a negative date being before the origin:

```
mydates <- c("1970-01-01", "2007-09-04", "1931-08-05")
(somedates <- tibble(text = mydates) %>%
    mutate(
    d = as.Date(text),
    numbers = as.numeric(d)
))
```

text	d	numbers
1970-01-01	1970-01-01	0
2007-09-04	2007-09-04	13760
1931-08-05	1931-08-05	-14029

Dates and times 5 / 28

Doing arithmetic with dates

• Dates are "actually" numbers, so can add and subtract (difference is 2007 date in d minus others):

text	d	numbers	plus30	diffs
1970-01-01	1970-01-01	0	1970-01-31	13760 days
2007-09-04	2007-09-04	13760	2007-10-04	0 days
1931-08-05	1931-08-05	-14029	1931-09-04	27789 days

Dates and times 6 / 28

Reading in dates from a file

 read_csv and the others can guess that you have dates, if you format them as year-month-day, like column 1 of this .csv:

```
date, status, dunno
2011-08-03, hello, August 3 2011
2011-11-15, still here, November 15 2011
2012-02-01, goodbye, February 1 2012
```

• Then read them in:

```
my_url <- "http://ritsokiguess.site/datafiles/mydates.csv"
ddd <- read_csv(my_url)</pre>
```

```
## Rows: 3 Columns: 3

## -- Column specification -----
## Delimiter: ","

## chr (2): status, dunno
```

The data as read in

ddd

date	status	dunno
2011-08-03 2011-11-15 2012-02-01	still here	August 3 2011 November 15 2011 February 1 2012

Dates and times 8 / 28

Dates in other formats

- Preceding shows that dates should be stored as text in format yyyy-mm-dd (ISO standard).
- convert. For example, dates in US format with month first:

To deal with dates in other formats, use package lubridate and

```
tibble(usdates = c("05/27/2012", "01/03/2016", "12/31/2015"))
  mutate(iso = mdy(usdates))
```

usdates	iso
05/27/2012 01/03/2016	2012-05-27 2016-01-03
12/31/2015	2015-12-31

Dates and times 9 / 28

Trying to read these as UK dates

```
tibble(usdates = c("05/27/2012", "01/03/2016", "12/31/2015"))
mutate(uk = dmy(usdates))
```

Warning: 2 failed to parse.

usdates	uk
05/27/2012	NA
01/03/2016	2016-03-01
12/31/2015	NA

 For UK-format dates with month second, one of these dates is legit, but the other two make no sense.

Our data frame's last column:

Back to this:

ddd

date	status	dunno
2011-08-03	hello	August 3 2011
2011-11-15	still here	November 15 2011
2012-02-01	goodbye	February 1 2012

Month, day, year in that order.

so interpret as such

date	status	dunno	date2
2011-08-03	hello	August 3 2011	2011-08-03
2011-11-15	still here	November 15 2011	2011-11-15
2012-02-01	goodbye	February 1 2012	2012-02-01

Dates and times 12 / 28

Are they really the same?

Column date2 was correctly converted from column dunno:

date	status	dunno	date2	equal
2011-08-03	hello	August 3 2011	2011-08-03	TRUE
2011-11-15	still here	November 15 2011	2011-11-15	TRUE
2012-02-01	goodbye	February 1 2012	2012-02-01	TRUE

The two columns of dates are all the same.

Dates and times 13 / 28

Making dates from pieces

```
Starting from this file:
```

Rows: 3 Columns: 3

year month day

##

```
1970 1 1
2007 9 4
1940 4 15
my_url <- "http://ritsokiguess.site/datafiles/pieces.txt"
dates0 <- read delim(my url, " ")</pre>
```

```
## -- Column specification
## Delimiter: " "
## dbl (3): year, month, day
```

i Use `spec()` to retrieve the full column specification for Dates and times

Making some dates

dates0

year	month	day
1970	1	1
2007	9	4
1940	4	15

```
dates0 %>%
  unite(dates, day, month, year) %>%
  mutate(d = dmy(dates)) -> newdates
```

The results

newdates

dates	d
1_1_1970	1970-01-01
4_9_2007	2007-09-04
15_4_1940	1940-04-15

- unite glues things together with an underscore between them (if you don't specify anything else). Syntax: first thing is new column to be created, other columns are what to make it out of.
- unite makes the original variable columns year, month, day disappear.
- The column dates is text, while d is a real date.

Extracting information from dates

```
newdates %>%
  mutate(
    mon = month(d),
    day = day(d),
    weekday = wday(d, label = T)
)
```

dates	d	mon	day	weekday
1_1_1970	1970-01-01	1	1	Thu
4_9_2007	2007-09-04	9	4	Tue
15_4_1940	1940-04-15	4	15	Mon

Dates and times 17 / 28

Dates and times

 Standard format for times is to put the time after the date, hours, minutes, seconds:

```
(dd <- tibble(text = c(
   "1970-01-01 07:50:01", "2007-09-04 15:30:00",
   "1940-04-15 06:45:10", "2016-02-10 12:26:40"
)))</pre>
```

text

1970-01-01 07:50:01 2007-09-04 15:30:00 1940-04-15 06:45:10 2016-02-10 12:26:40

Dates and times 18 / 28

Converting text to date-times:

• Then get from this text using ymd_hms:

```
dd %>% mutate(dt = ymd_hms(text))
```

text	dt
1970-01-01 07:50:01	1970-01-01 07:50:01
2007-09-04 15:30:00	2007-09-04 15:30:00
1940-04-15 06:45:10	1940-04-15 06:45:10
2016-02-10 12:26:40	2016-02-10 12:26:40

Dates and times 19 / 28

Timezones

 Default timezone is "Universal Coordinated Time". Change it via tz= and the name of a timezone:

```
dd %>%
 mutate(dt = ymd_hms(text, tz = "America/Toronto")) -> dd
dd %>% mutate(zone = tz(dt))
```

text	dt	zone
1970-01-01 07:50:01	1970-01-01 07:50:01	America/Toronto
2007-09-04 15:30:00	2007-09-04 15:30:00	America/Toronto
1940-04-15 06:45:10	1940-04-15 06:45:10	America/Toronto
2016-02-10 12:26:40	2016-02-10 12:26:40	America/Toronto

20 / 28

Extracting time parts

As you would expect:

```
dd %>%
  select(-text) %>%
  mutate(
    h = hour(dt),
    sec = second(dt),
    min = minute(dt),
    zone = tz(dt)
)
```

dt	h	sec	min	zone
1970-01-01 07:50:01	7	1	50	America/Toronto
2007-09-04 15:30:00	15	0	30	America/Toronto
1940-04-15 06:45:10	6	10	45	${\sf America}/{\sf Toronto}$
2016-02-10 12:26:40	12	40	26	${\sf America}/{\sf Toronto}$

Same times, but different time zone:

```
dd %>%
  select(dt) %>%
  mutate(oz = with_tz(dt, "Australia/Sydney"))
```

dt	OZ
1970-01-01 07:50:01	1970-01-01 22:50:01
2007-09-04 15:30:00	2007-09-05 05:30:00
1940-04-15 06:45:10	1940-04-15 21:45:10
2016-02-10 12:26:40	2016-02-11 04:26:40

In more detail:

```
## [1] "1970-01-01 22:50:01 AEST"
## [2] "2007-09-05 05:30:00 AEST"
## [3] "1940-04-15 21:45:10 AEST"
## [4] "2016-02-11 04:26:40 AEDT"
Dates and times
```

How long between date-times?

 We may need to calculate the time between two events. For example, these are the dates and times that some patients were admitted to and discharged from a hospital:

```
admit,discharge

1981-12-10 22:00:00,1982-01-03 14:00:00

2014-03-07 14:00:00,2014-03-08 09:30:00

2016-08-31 21:00:00,2016-09-02 17:00:00
```

Dates and times 23 / 28

Do they get read in as date-times?

• These ought to get read in and converted to date-times:

```
my_url <- "http://ritsokiguess.site/datafiles/hospital.csv"
stays <- read_csv(my_url)</pre>
## Rows: 3 Columns: 2
## -- Column specification -----
## Delimiter: "."
## dttm (2): admit, discharge
##
## i Use `spec()` to retrieve the full column specification for
## i Specify the column types or set `show_col_types = FALSE`
  and so it proves.
```

Subtracting the date-times

• In the obvious way, this gets us an answer:

```
stays %>% mutate(stay = discharge - admit)
```

admit	discharge	stay
1981-12-10 22:00:00	1982-01-03 14:00:00	568.0 hours
2014-03-07 14:00:00	2014-03-08 09:30:00	19.5 hours
2016-08-31 21:00:00	2016-09-02 17:00:00	44.0 hours

Number of hours; hard to interpret.

Days

Fractional number of days would be better:

```
# stays %>%
# mutate(stay_days = (discharge - admit) / ddays(1))
stays %>%
mutate(
    stay days = as.period(admit %--% discharge) / days(1))
```

admit	discharge	stay_days
1981-12-10 22:00:00	1982-01-03 14:00:00	23.666667
2014-03-07 14:00:00	2014-03-08 09:30:00	0.812500
2016-08-31 21:00:00	2016-09-02 17:00:00	1.833333

Dates and times 26 / 28

Completed days

Pull out with day() etc, as for a date-time

```
error here ****
stays %>%
  mutate(
    stay = as.period(admit %--% discharge),
    stay_days = day(stay),
    stay_hours = hour(stay)
    ) %>%
  select(starts_with("stay"))
```

stay	stay_days	stay_hours
23d 16H 0M 0S	23	16
19H 30M 0S	0	19
1d 20H 0M 0S	1	20

Comments

- Date-times are stored internally as seconds-since-something, so that subtracting two of them will give, internally, a number of seconds.
- Just subtracting the date-times is displayed as a time (in units that R chooses for us).
- Functions ddays(1), dminutes(1) etc. will give number of seconds in a day or a minute, thus dividing by them will give (fractional) days, minutes etc. This works for things like days/minutes with equal numbers of seconds, but not months/years.
- Better: convert to a "period", then divide by days(1), months(1) etc.
- These ideas useful for calculating time from a start point until an event happens (in this case, a patient being discharged from hospital).
