Factor Analysis

Principal components and factor analysis

- Principal components:
 - Purely mathematical.
 - Find eigenvalues, eigenvectors of correlation matrix.
 - No testing whether observed components reproducible, or even probability model behind it.
- Factor analysis:
 - some way towards fixing this (get test of appropriateness)
 - In factor analysis, each variable modelled as: "common factor" (eg. verbal ability) and "specific factor" (left over).
 - Choose the common factors to "best" reproduce pattern seen in correlation matrix.
 - Iterative procedure, different answer from principal components.

Factor Analysis 2 / 81

Packages

```
library(ggbiplot)
library(tidyverse)
```

Example

- 145 children given 5 tests, called PARA, SENT, WORD, ADD and DOTS. 3 linguistic tasks (paragraph comprehension, sentence completion and word meaning), 2 mathematical ones (addition and counting dots).
- Correlation matrix of scores on the tests:

```
para 1 0.722 0.714 0.203 0.095 sent 0.722 1 0.685 0.246 0.181 word 0.714 0.685 1 0.170 0.113 add 0.203 0.246 0.170 1 0.585 dots 0.095 0.181 0.113 0.585 1
```

• Is there small number of underlying "constructs" (unobservable) that explains this pattern of correlations?

Factor Analysis 4 / 81

To start: principal components

Using correlation matrix. Read that first:

```
my_url <- "http://ritsokiguess.site/datafiles/rex2.txt"
kids <- read_delim(my_url, " ")
kids</pre>
```

test	para	sent	word	add	dots
para	1.000	0.722	0.714	0.203	0.095
sent	0.722	1.000	0.685	0.246	0.181
word	0.714	0.685	1.000	0.170	0.113
add	0.203	0.246	0.170	1.000	0.585
dots	0.095	0.181	0.113	0.585	1.000

Factor Analysis 5 / 81

Principal components on correlation matrix

Turn into R matrix, using column test as column names:

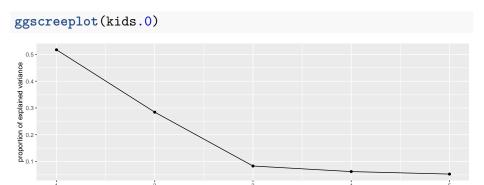

```
kids %>%
column_to_rownames("test") %>%
as.matrix() -> m
```

Principal components:

```
kids.0 <- princomp(covmat = m)
```

Lused kids. 0 here since Lwant kids. 1 and kids. 2 later.

Scree plot

principal component number

Principal component results

Need 2 components. Loadings:

```
kids.0$loadings
```

```
##
## Loadings:
##
      Comp.1 Comp.2 Comp.3 Comp.4 Comp.5

                              0.6 0.8 1.0
```

Factor Analysis 8 / 81

Comments

- First component has a bit of everything, though especially the first three tests.
- Second component rather more clearly add and dots.
- No scores, plots since no actual data.
- See how factor analysis compares on these data.

Factor analysis

- Specify number of factors first, get solution with exactly that many factors.
- Includes hypothesis test, need to specify how many children wrote the tests.
- Works from correlation matrix via covmat or actual data, like princomp.
- Introduces extra feature, *rotation*, to make interpretation of loadings (factor-variable relation) easier.

Factor analysis for the kids data

- Create "covariance list" to include number of children who wrote the tests.
- Feed this into factanal, specifying how many factors (2).
- Start with the matrix we made before.

```
m
```

```
## para sent word add dots
## para 1.000 0.722 0.714 0.203 0.095
## sent 0.722 1.000 0.685 0.246 0.181
## word 0.714 0.685 1.000 0.170 0.113
## add 0.203 0.246 0.170 1.000 0.585
## dots 0.095 0.181 0.113 0.585 1.000
```

```
ml <- list(cov = m, n.obs = 145)
kids.2 <- factanal(factors = 2, covmat = m1)</pre>
```

Factor Analysis 11 / 81

Uniquenesses

kids.2\$uniquenesses

```
##
       para
                 sent
                      word
                                      add
                                               dots
  0.2424457 0.2997349 0.3272312 0.5743568 0.1554076
```

- Uniquenesses say how "unique" a variable is (size of specific factor). Small uniqueness means that the variable is summarized by a factor (good).
- Very large uniquenesses are bad; add's uniqueness is largest but not large enough to be worried about.
- Also see "communality" for this idea, where large is good and small is bad.

12 / 81

Loadings

kids.2\$loadings

```
##
## Loadings:
       Factor1 Factor2
##
## para 0.867
## sent 0.820
              0.166
## word 0.816
## add 0.167 0.631
## dots
            0.918
##
                 Factor1 Factor2
##
  SS loadings
               2.119 1.282
## Proportion Var 0.424 0.256
## Cumulative Var 0.424 0.680
```

• Loadings show how each factor depends on variables. Blanks indicate "small", less than 0.1.

Factor Analysis 13 / 81

Comments

- Factor 1 clearly the "linguistic" tasks, factor 2 clearly the "mathematical" ones.
- Two factors together explain 68% of variability (like regression R-squared).
- Which variables belong to which factor is much clearer than with principal components.

14/81

Are 2 factors enough?

```
kids.2$STATISTIC

## objective
## 0.5810578
kids.2$dof

## [1] 1
kids.2$PVAL
```

P-value not small, so 2 factors OK.

objective

1 factor

##

objective

2.907856e-11

```
kids.1 <- factanal(factors = 1, covmat = ml)
kids.1$STATISTIC

## objective
## 58.16534
kids.1$dof

## [1] 5
kids.1$PVAL</pre>
```

1 factor rejected (P-value small). Definitely need more than 1.

Places rated, again

• Read data, transform, rerun principal components, get biplot:

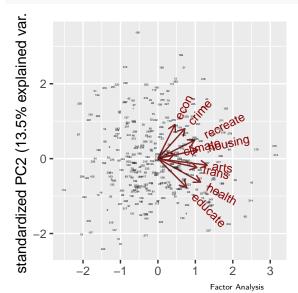

my_url <- "http://ritsokiguess.site/datafiles/places.txt"

This is all exactly as for principal components (nothing new here).

Factor Analysis 17 / 81

The biplot

Comments

- Most of the criteria are part of components 1 and 2.
- If we can rotate the arrows counterclockwise:
 - economy and crime would point straight up
 - part of component 2 only
 - health and education would point to the right
 - part of component 1 only
- would be easier to see which variables belong to which component.
- Factor analysis includes a rotation to help with interpretation.

Factor Analysis 19 / 81

Factor analysis

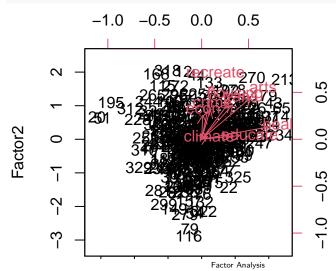

- Have to pick a number of factors first.
- Do this by running principal components and looking at scree plot.
- In this case, 3 factors seemed good (revisit later):

```
places.3 <- factanal(places_numeric, 3, scores = "r")</pre>
```

 There are different ways to get factor scores. These called "regression" scores.

A bad biplot

biplot(places.3\$scores, places.3\$loadings,
 xlabs = places\$id)

Comments

- I have to find a way to make a better biplot!
- Some of the variables now point straight up and some straight across (if you look carefully for the red arrows among the black points).
- This should make the factors more interpretable than the components were.

22 / 81

Factor loadings

places.3\$loadings

```
##
## Loadings:
##
           Factor1 Factor2 Factor3
## climate
                            0.994
                            0.229
## housing

                    0.552
                            0.102
## arts
                    0.714
## recreate
            0.148
## econ
                    0.318 - 0.114
##
##
                 Factor1 Factor2 Factor3
  SS loadings
                   1.814
                           1.551
                                  1.120
## Proportion Var 0.202 0.172 0.124
  Cumulative Var
                   0.202
                          0.374
                                  0.498
```

Factor Analysis

Comments on loadings

- These are at least somewhat clearer than for the principal components:
 - Factor 1: health, education, arts: "well-being"
 - Factor 2: housing, transportation, arts (again), recreation: "places to be"
 - Factor 3: climate (only): "climate"
- In this analysis, economic factors don't seem to be important.

Factor scores

• Make a dataframe with the city IDs and factor scores:

```
cbind(id = places$id, places.3$scores) %>%
  as_tibble() -> places_scores
```

• Make percentile ranks again (for checking):

```
places %>%
  mutate(across(-id, ~percent_rank(.))) -> places_pr
```

Highest scores on factor 1, "well-being":

• for the top 4 places:

```
places_scores %>%
  slice_max(Factor1, n = 4)
```

id	Factor1	Factor2	Factor3
213	2.469554	1.7788333	0.5060550
65	2.385729	0.9247505	-0.2870941
234	2.324346	0.1216503	0.5239580
314	2.221426	0.6714295	0.5208330

Factor Analysis

26 / 81

Check percentile ranks for factor 1

```
places_pr %>%
  select(id, health, educate, arts) %>%
  filter(id %in% c(213, 65, 234, 314))
```

id	health	educate	arts
65	0.9969512	0.9634146	0.9969512
213	1.0000000	0.7225610	1.0000000
234	0.9908537	1.0000000	0.9847561
314	0.9847561	0.9939024	0.9908537

- These are definitely high on the well-being variables.
- City #213 is not so high on education, but is highest of all on the others.

Factor Analysis 27 / 81

Highest scores on factor 2, "places to be":

```
places_scores %>%
slice_max(Factor2, n = 4)
```

id	Factor1	Factor2	Factor3
318	-1.0124822	2.046099	-0.0957484
12	-0.5397677	2.019278	-3.8038802
168	-1.3485804	1.940127	0.2734326
44	-0.1492306	1.916696	-0.5558097

Check percentile ranks for factor 2

```
places_pr %>%
  select(id, housing, trans, arts, recreate) %>%
  filter(id %in% c(318, 12, 168, 44))
```

id	housing	trans	arts	recreate
12	0.9329268	0.7286585	0.6036585	0.8963415
44	0.9268293	0.9634146	0.7347561	0.9878049
168	0.8323171	0.8719512	0.4420732	0.9786585
318	0.8810976	0.7439024	0.6676829	0.9634146

- These are definitely high on housing and recreation.
- Some are (very) high on transportation, but not so much on arts.
- Could look at more cities to see if #168 being low on arts is a fluke.

Factor Analysis 29 / 81

Highest scores on factor 3, "climate":

```
places_scores %>%
  slice_max(Factor3, n = 4)
```

id	Factor1	Factor2	Factor3
227	-0.1838076	0.3850312	2.039536
218	0.8809663	0.8966425	2.021177
269	0.9315705	1.1891810	1.977220
270	1.5031372	1.8418356	1.938905

Factor Analysis

30 / 81

Check percentile ranks for factor 3

```
places_pr %>%
  select(id, climate) %>%
  filter(id %in% c(227, 218, 269, 270))
```

id	climate
218	0.9969512
227	0.9908537
269	0.9939024
270	0.9969512

This is very clear.

Uniquenesses

• We said earlier that the economy was not part of any of our factors:

places.3\$uniquenesses

```
## climate housing health crime trans
## 0.0050000 0.5859175 0.1854084 0.7842407 0.6165449
## educate arts recreate econ
## 0.7351921 0.2554663 0.4618143 0.8856382
```

- The higher the uniqueness, the less the variable concerned is part of any of our factors (and that maybe another factor is needed to accommodate it).
- This includes economy and maybe crime.

Factor Analysis 32 / 81

Test of significance

We can test whether the three factors that we have is enough, or whether we need more to describe our data:

```
places.3$PVAL
```

```
## objective
## 1.453217e-14
```

- 3 factors are not enough.
- What would 5 factors look like?

Five factors

Cumulative Var

```
places.5 <- factanal(places_numeric, 5, scores = "r")</pre>
places.5$loadings
##
## Loadings:
##
           Factor1 Factor2 Factor3 Factor4 Factor5

0.575

0.340

Comments

- On (new) 5 factors:
 - Factor 1 is health, education, arts: same as factor 1 before.
 - Factor 2 is housing, transportation, arts, recreation: as factor 2 before.
 - Factor 3 is economy.
 - Factor 4 is crime.
 - Factor 5 is climate and housing: like factor 3 before.
- The two added factors include the two "missing" variables.
- Is this now enough?

places.5\$PVAL

```
## objective
## 0.0009741394
```

No. My guess is that the authors of Places Rated chose their 9 criteria
to capture different aspects of what makes a city good or bad to live in,
and so it was too much to hope that a small number of factors would
come out of these.

Factor Analysis

35 / 81

A bigger example: BEM sex role inventory

- 369 women asked to rate themselves on 60 traits, like "self-reliant" or "shy".
- Rating 1 "never or almost never true of me" to 7 "always or almost always true of me".
- 60 personality traits is a lot. Can we find a smaller number of factors that capture aspects of personality?
- The whole BEM sex role inventory on next page.

The whole inventory

- self reliant
 yielding
- 3. helpful
- defends own
- beliefs
- cheerful
- 6. moody
- 7. independent
- 8. shy
- 9. conscientious
- 10.athletic
- 11.affectionate
- 12.theatrical
- 13.assertive 14.flatterable
- 15.happy
- 16.strong personality
- 17.loyal
- 18.unpredictable
- 19.forceful
- 20.feminine

- 21.reliable
- 22.analytical
- 23.sympathetic
- 24.jealous
- 25.leadership ability 26.sensitive to other's needs
- 27.truthful
- 28.willing to take risks
- 29.understanding
- 31.makes decisions easily
- 32.compassionate
- 34.self-sufficient
- 35.eager to soothe hurt
 - feelings
- 36.conceited
- 37.dominant
- 38.soft spoken
- 39.likable
- 40.masculine

- 41.warm
- 42.solemn
- 43.willing to take a stand
- 44.tender
- 45.friendly 46.aggressive
- 47.gullible
- 48.inefficient
- 49.acts as a leader
- 50.childlike
- 51.adaptable
- 52.individualistic
- 53.does not use harsh language
- 54.unsystematic 55.competitive
- 56.loves children
- 57.tactful
- 58.ambitious
- 59.gentle
- 60.conventional

Factor Analysis 38 / 81

Principal components first

...to decide on number of factors:

```
bem.pc <- bem %>%
  select(-subno) %>%
  princomp(cor = T)
```

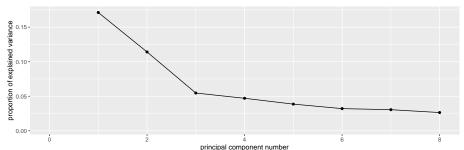

The scree plot

No obvious elbow.

Zoom in to search for elbow

Possible elbows at 3 (2 factors) and 6 (5):

but is 2 really good?

summary(bem.pc)

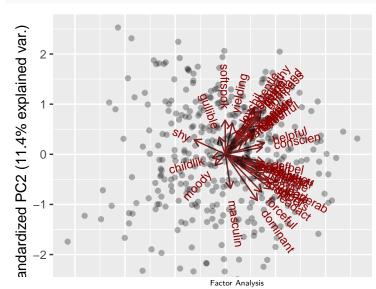

```
## Importance of components:

```

Comments

- Want overall fraction of variance explained ("cumulative proportion") to be reasonably high.
- 2 factors, 28.5%. Terrible!
- Even 56% (10 factors) not that good!
- Have to live with that.

Biplot

ggbiplot(bem.pc, alpha = 0.3)

Comments

- Ignore individuals for now.
- Most variables point to 1 o'clock or 4 o'clock.
- Suggests factor analysis with rotation will get interpretable factors (rotate to 12 o'clock and 3 o'clock, for example).
- Try for 2-factor solution (rough interpretation, will be bad):

```
bem %>%
select(-subno) %>%
factanal(factors = 2) -> bem.2
```

Show output in pieces (just print bem.2 to see all of it).

Uniquenesses, sorted

sort(bem.2\$uniquenesses)

46 / 81

Comments

- Mostly high or very high (bad).
- Some smaller, eg.: Leadership ability (0.409), Acts like leader (0.417), Warm (0.476), Tender (0.493).
- Smaller uniquenesses captured by one of our two factors.
- Larger uniquenesses are not: need more factors to capture them.

Factor loadings, some

Making a data frame

There are too many to read easily, so make a data frame. A bit tricky:

```
bem.2$loadings %>%
  unclass() %>%
  as_tibble() %>%
  mutate(trait = rownames(bem.2$loadings)) -> loadings
loadings %>% slice(1:8)
```

Factor1	Factor2	trait
0.3137466	0.3764849	helpful
0.4532904	0.1171406	reliant
0.4336574	0.1926030	defbel
-0.1309965	0.3376293	yielding
0.1523718	0.3705305	cheerful
0.5212403	0.0058703	indpt
0.2670788	0.0755429	athlet
-0.4144579	-0.0653728	shy
		•

Factor Analysis 49 / 81

Pick out the big ones on factor 1

loadings %>% filter(abs(Factor1) > 0.4)

Arbitrarily defining > 0.4 or < -0.4 as "big":

trait	Factor2	Factor1

Factor Analysis

51/81

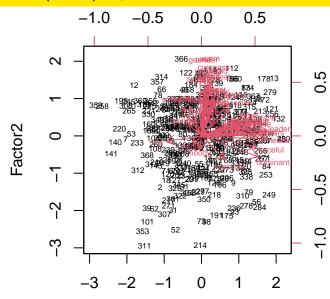

Plotting the two factors

- A bi-plot, this time with the variables reduced in size. Looking for unusual individuals.
- Have to run factanal again to get factor scores for plotting.

```
bem %>% select(-subno) %>%
  factanal(factors = 2, scores = "r") -> bem.2a
biplot(bem.2a$scores, bem.2a$loadings, cex = c(0.5, 0.5))
```

• Numbers on plot are row numbers of bem data frame.

The (awful) biplot

Comments

- Variables mostly up ("feminine") and right ("masculine"), accomplished by rotation.
- Some unusual individuals: 311, 214 (low on factor 2), 366 (high on factor 2), 359, 258 (low on factor 1), 230 (high on factor 1).

Individual 366

bem %>% slice(366) %>% glimpse()

```
## Rows: 1
## Columns: 45
## $ subno
           <db1> 755
## $ helpful <dbl> 7
## $ reliant <dbl> 7
## $ defbel <dbl> 5

```

Comments

- Individual 366 high on factor 2, but hard to see which traits should have high scores (unless we remember).
- Idea 1: use percentile ranks as before.
- Idea 2: Rating scale is easy to interpret. So *tidy* original data frame to make easier to look things up.

Tidying original data

Factor Analysis 59 / 81

Individual 366, high on Factor 2

So now pick out the rows of the tidy data frame that belong to individual 366 (row=366) and for which the Factor2 score exceeds 0.4 in absolute value (our "big" from before):

```
bem_tidy %>% filter(row == 366, abs(Factor2) > 0.4)
```

subno	row	trait	score	Factor1	Factor2
755	366	affect	7	0.1778911	0.5537994
755	366	loyal	7	0.1512127	0.4166622
755	366	sympathy	7	0.0230146	0.5256654
755	366	sensitiv	7	0.1347697	0.4242037
755	366	undstand	7	0.0911130	0.6101294
755	366	compass	6	0.1135064	0.6272223
755	366	soothe	7	0.0606175	0.5802714
755	366	happy	7	0.1189301	0.4300698
755	366	warm	7	0.0795698	0.7191610
755	366	tender	7	0.0511381	0.7102763
755	366	gentle	7	-0.0187322	0.7022768

As expected, high scorer on these.

Factor Analysis 60 / 81

Several individuals

Rows 311 and 214 were *low* on Factor 2, so their scores should be low. Can we do them all at once?

```
bem_tidy %>% filter(
  row %in% c(366, 311, 214),
  abs(Factor2) > 0.4
)
```

subno	row	trait	score	Factor1	Factor2
369	214	affect	1	0.1778911	0.5537994
369	214	loyal	7	0.1512127	0.4166622
369	214	sympathy	4	0.0230146	0.5256654
369	214	sensitiv	7	0.1347697	0.4242037
369	214	undstand	5	0.0911130	0.6101294
369	214	compass	5	0.1135064	0.6272223
369	214	soothe	3	0.0606175	0.5802714
369	214	happy	4	0.1189301	0.4300698
369	214	warm	1	0.0795698	0.7191610
369	214	tender	3	0.0511381	0.7102763
369	214	gentle	2	-0.0187322	0.7022768
534	311	affect	5	0.1778911	0.5537994
534	311	loyal	4	0.1512127	0.4166622

Individual by column

Un-tidy, that is, pivot_wider:

```
bem_tidy %>%
filter(
   row %in% c(366, 311, 214),
   abs(Factor2) > 0.4
) %>%
select(-subno, -Factor1, -Factor2) %>%
pivot_wider(names_from=row, values_from=score)
```

trait	214	311	366
affect	1	5	7
loyal	7	4	7
sympathy	4	4	7
sensitiv	7	4	7
undstand	5	3	7
compass	5	4	6
soothe	3	4	7
happy	4	3	7
warm	1	3	7
tender	3	4	7
gentle	2	3	7

366 high, 311 middling, 214 (sometimes) low.

Individuals 230, 258, 359

These were high, low, low on factor 1. Adapt code:

```
bem_tidy %>%
filter(row %in% c(359, 258, 230), abs(Factor1) > 0.4) %>%
select(-subno, -Factor1, -Factor2) %>%
pivot_wider(names_from=row, values_from=score)
```

trait	230	258	359
reliant	7	4	1
defbel	7	1	1
indpt	7	7	1
shy	2	7	5
assert	7	3	1
strpers	7	1	3
forceful	7	1	1
leaderab	7	1	1
risk	7	5	7
decide	7	1	2
selfsuff	7	4	1
dominant	7	1	1
stand	7	1	6
leadact	7	1	1
individ	7	3	3
compete	6	2	1
ambitiou	7	2	4

Is 2 factors enough?

```
Suspect not: bem.2$PVAL
```

```
## objective
## 1.458183e-150
```

 $2\ \mbox{factors}$ resoundingly rejected. Need more. Have to go all the way to $15\ \mbox{factors}$ to not reject:

```
bem %>%
  select(-subno) %>%
  factanal(factors = 15) -> bem.15
bem.15$PVAL
```

objective ## 0.132617

Even then, only just over 50% of variability explained.

What's important in 15 factors?

- Let's take a look at the important things in those 15 factors.
- Get 15-factor loadings into a data frame, as before:

```
bem.15$loadings %>%
  unclass() %>%
  as_tibble() %>%
  mutate(trait = rownames(bem.15$loadings)) -> loadings
```

• then show the highest few loadings on each factor.

Factor 1 (of 15)

```
loadings %>%
  arrange(desc(abs(Factor1))) %>%
  select(Factor1, trait) %>%
  slice(1:10)
```

Factor1	trait
0.8127595	compass
0.6756043	undstand
0.6611293	sympathy
0.6408327	sensitiv
0.5971006	soothe
0.3481290	warm
0.2797159	gentle
0.2788627	tender
0.2501505	helpful
0.2340594	conscien

Compassionate, understanding, sympathetic, soothing: thoughtful of others.

Factor Analysis 66 / 81

```
loadings %>%
  arrange(desc(abs(Factor2))) %>%
  select(Factor2, trait) %>%
  slice(1:10)
```

Factor2	trait
0.7615492 0.7160312	strpers forceful
0.6981500	assert
0.5041921 0.3929344	dominant leaderab
0.3669560	stand
0.3507080	leadact
-0.3131682	softspok
-0.2866862 0.2602525	shy analyt

Strong personality, forceful, assertive, dominant: getting ahead.

Factor Analysis 67 / 81

```
loadings %>%
  arrange(desc(abs(Factor3))) %>%
  select(Factor3, trait) %>%
  slice(1:10)
```

Factor3	trait
0.6697542	reliant
0.6475496	selfsuff
0.6204018	indpt
0.3899607	helpful
-0.3393605	gullible

0.2449656	decide
0.2064415	dominant
0.1928159	leadact
0.1854989	strpers

Ambitious, competitive (with a bit of risk-taking and individualism): Being the best.

```
loadings %%
arrange(desc(abs(Factor6))) %%%
select(Factor6, trait) %%
slice(1:10)
```

Factor6	trait
0.8675651	leadact
0.6078869	leaderab
0.3378645	dominant
0.2014835	forceful
-0.1915632	shy
0.1789256	risk
0.1703440	masculin
0.1639190	decide
0.1594585	compete
0.1466037	athlet

Acts like a leader, leadership ability (with a bit of Dominant): Taking charge.

Factor Analysis 71 / 81

```
loadings %>%
  arrange(desc(abs(Factor7))) %>%
  select(Factor7, trait) %>%
  slice(1:10)
```

Factor7	trait
0.6698996	happy
0.6667105	cheerful
-0.5219125	moody
0.2191425	athlet
0.2126626	warm
0.1719953	gentle
