# Analysis of Covariance

# Analysis of covariance

- ➤ ANOVA: explanatory variables categorical (divide data into groups)
- lacktriangle traditionally, analysis of covariance has categorical x's plus one numerical x ("covariate") to be adjusted for.
- 1m handles this too.
- Simple example: two treatments (drugs) (a and b), with before and after scores.
- Does knowing before score and/or treatment help to predict after score?
- ▶ Is after score different by treatment/before score?

#### Data

Treatment, before, after:

a 5 20

a 10 23

a 12 30 a 9 25

a 23 34

a 21 40

a 14 27 a 18 38

a 6 24

a 6 24

a 13 31 b 7 19

b 12 26 b 27 33

b 24 35

b 18 30 b 22 31

b 26 34

# **Packages**

```
library(tidyverse)
library(broom)
library(marginaleffects)
```

the last of these for predictions.

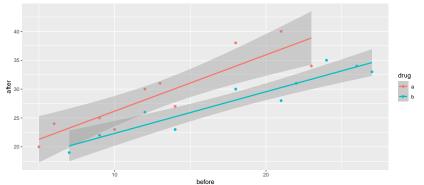

## Read in data

```
url <- "http://ritsokiguess.site/datafiles/ancova.txt"
prepost <- read_delim(url, " ")
prepost</pre>
```

```
# A tibble: 20 x 3
  drug before after
   <chr> <dbl> <dbl>
 1 a
              5
                   20
 2 a
             10 23
3 a
             12
                   30
4 a
                   25
 5 a
            23
                   34
6 a
             21
                   40
7 a
            14
                   27
8 a
             18
                   38
9 a
             6
                   24
10 a
             13
                   31
11 b
                   19
```

## Making a plot

```
ggplot(prepost, aes(x = before, y = after, colour = drug))
geom_point() + geom_smooth(method = "lm")
```

#### Comments

- As before score goes up, after score goes up.
- Red points (drug A) generally above blue points (drug B), for comparable before score.
- Suggests before score effect and drug effect.

#### The means

```
prepost %>%
  group_by(drug) %>%
  summarize(
   before_mean = mean(before),
   after_mean = mean(after)
)
```

- ▶ Mean "after" score slightly higher for treatment A.
- Mean "before" score much higher for treatment B.
- Greater improvement on treatment A.

```
Testing for interaction
  prepost.1 <- lm(after ~ before * drug, data = prepost)
  anova(prepost.1)</pre>
```

Analysis of Variance Table

Response: after

Call:

```
Df Sum Sq Mean Sq F value Pr(>F)
before 1 430.92 430.92 62.6894 6.34e-07 ***
drug 1 115.31 115.31 16.7743 0.0008442 ***
before:drug 1 12.34 12.34 1.7948 0.1990662
Residuals 16 109.98 6.87
---
Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 '
summary(prepost.1)
```

lm(formula = after ~ before \* drug, data = prepost)

## **Predictions**

Set up values to predict for:

```
summary(prepost)
```

```
before after
    drug
                  Min. : 5.00 Min. :19.00
Length:20
Class: character 1st Qu.: 9.75 1st Qu.: 23.75
Mode :character Median :14.00 Median :29.00
                  Mean :15.55
                                Mean :28.65
                  3rd Qu.:21.25 3rd Qu.:33.25
                  Max. :27.00 Max. :40.00
new <- datagrid(before = c(9.75, 14, 21.25),
              drug = c("a", "b"), model = prepost.1)
new
```

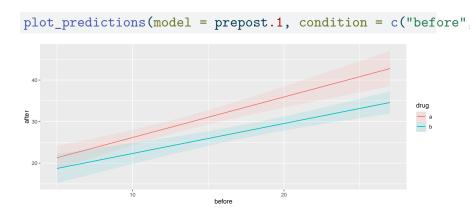

```
before drug rowid
1 9.75 a 1
2 9.75 b 2
3 14.00 a 3
```

#### and then

```
cbind(predictions(prepost.1, newdata = new)) %>%
  select(drug, before, estimate, conf.low, conf.high)
```

```
drug before estimate conf.low conf.high
1 a 9.75 25.93250 24.05059 27.81442
2 b 9.75 22.14565 19.58681 24.70450

4 b 14.00 25.21304 23.32649 27.09959
5 a 21.25 37.14929 34.32557 39.97300
6 b 21.25 30.44565 28.64373 32.24758
```

# Predictions (with interaction included), plotted

Lines almost parallel, but not quite.

# Taking out interaction

```
prepost.2 <- update(prepost.1, . ~ . - before:drug)
summary(prepost.2)</pre>
```

```
Call:
lm(formula = after ~ before + drug, data = prepost)

Residuals:
    Min    1Q Median    3Q Max
```

-3.6348 -2.5099 -0.2038 1.8871 4.7453

#### Coefficients:

```
Estimate Std. Error t value Pr(>|t|)
(Intercept) 18.3600 1.5115 12.147 8.35e-10 ***
before 0.8275 0.0955 8.665 1.21e-07 ***
drugb -5.1547 1.2876 -4.003 0.000921 ***
```

Residual standard error: 2.682 on 17 degrees of freedom Multiple R-squared: 0.817, Adjusted R-squared: 0.7955

Signif. codes: 0 '\*\*\*' 0.001 '\*\*' 0.01 '\*' 0.05 '.' 0.1 ' ' 1

### **Predictions**

```
cbind(predictions(prepost.2, newdata = new)) %>%
  select(drug, before, estimate)
```

```
drug before estimate

1 a 9.75 26.42794

2 b 9.75 21.27328

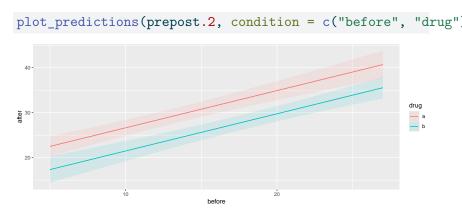

3 a 14.00 29.94473

4 b 14.00 24.79007

5 a 21.25 35.94397

6 b 21.25 30.78931
```

# Plot of predicted values

This time the lines are *exactly* parallel. No-interaction model forces them to have the same slope.

## Different look at model output

- anova(prepost.2) tests for significant effect of before score and of drug, but doesn't help with interpretation.
- summary(prepost.2) views as regression with slopes:

```
summary(prepost.2)
```

```
Call:
lm(formula = after ~ before + drug, data = prepost)
Residuals:
   Min
       10 Median
                          30
                                 Max
-3.6348 -2.5099 -0.2038 1.8871 4.7453
Coefficients:
           Estimate Std. Error t value Pr(>|t|)
(Intercept) 18.3600 1.5115 12.147 8.35e-10 ***
before
         0.8275 0.0955 8.665 1.21e-07 ***
     -5.1547 1.2876 -4.003 0.000921 ***
drugb
Signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
Residual standard error: 2.682 on 17 degrees of freedom
```

Multiple R-squared: 0.817, Adjusted R-squared: 0.7955

## Understanding those slopes

tidy(prepost.2)

- before ordinary numerical variable; drug categorical.
- Im uses first category druga as baseline.
- ▶ Intercept is prediction of after score for before score 0 and drug A.
- before slope is predicted change in after score when before score increases by 1 (usual slope)
- Slope for drugb is change in predicted after score for being on drug B rather than drug A. Same for any before score (no interaction).

## Summary

- ➤ ANCOVA model: fits different regression line for each group, predicting response from covariate.
- ANCOVA model with interaction between factor and covariate allows different slopes for each line.
- Sometimes those lines can cross over!
- If interaction not significant, take out. Lines then parallel.
- With parallel lines, groups have consistent effect regardless of value of covariate.
