Durations, intervals, and periods

Packages for this section

library(tidyverse)

Dates and times live in a package called lubridate, but this is now part of the tidyverse.

Exact time intervals

We previously got fractional days (of stays in hospital):

```
my_url <- "http://ritsokiguess.site/datafiles/hospital.csv"
stays <- read_csv(my_url)
stays %>% mutate(stay_days = (discharge - admit) / ddays(1))
```

but what if we wanted days, hours and minutes?

Intervals

A tibble: 3 x 3

```
stays %>% mutate(stay = admit %--% discharge)
```

```
admit discharge stay

<dttm> <dttm> <fttm> <1 1981-12-10 22:00:00 1982-01-03 14:00:00 1981-12-10 22:00

2 2014-03-07 14:00:00 2014-03-08 09:30:00 2014-03-07 14:00
```

- 3 2016-08-31 21:00:00 2016-09-02 17:00:00 2016-08-31 21:00
 - ▶ These are called *intervals*: they have a start point and an end point.

Periods

To work out the exact length of an interval, in human units, turn it into a period:

A period is exact as long as it has a start and an end (accounting for daylight savings, leap years etc).

Completed days

Take day of the periods:

```
stays %>% mutate(stay = as.period(admit %--% discharge)) %>%
  mutate(days_of_stay = day(stay))
```

Completed hours 1/2

Not quite what you think:

```
stays %>% mutate(stay = as.period(admit %--% discharge)) %>%
mutate(hours_of_stay = hour(stay))
```

```
# A tibble: 3 x 4
admit discharge stay hours_of
<dttm> <dttm> <Period>

1 1981-12-10 22:00:00 1982-01-03 14:00:00 23d 16H 0M 0S
2 2014-03-07 14:00:00 2014-03-08 09:30:00 19H 30M 0S
3 2016-08-31 21:00:00 2016-09-02 17:00:00 1d 20H 0M 0S
```

These are completed hours within days.

Completed hours 2/2

To get total hours, count each day as 24 hours also:

```
stays %>% mutate(stay = as.period(admit %--% discharge)) %>%
mutate(hours_of_stay = hour(stay) + 24*day(stay))
```

```
# A tibble: 3 x 4

admit discharge stay hours_of

<dttm> <dttm> <Period>

1 1981-12-10 22:00:00 1982-01-03 14:00:00 23d 16H 0M 0S

2 2014-03-07 14:00:00 2014-03-08 09:30:00 19H 30M 0S

3 2016-08-31 21:00:00 2016-09-02 17:00:00 1d 20H 0M 0S
```

Durations

A tibble: 3 x 3

What's the difference between duration and period?

```
stays %>% mutate(stay = as.duration(admit %--% discharge))
```

```
admit discharge stay
<dttm> <dttm> <Duration>

1 1981-12-10 22:00:00 1982-01-03 14:00:00 2044800s (~3.38 to 2 2014-03-07 14:00:00 2014-03-08 09:30:00 70200s (~19.5 hor
```

- 3 2016-08-31 21:00:00 2016-09-02 17:00:00 158400s (~1.83 da
 - A duration is always a number of *seconds*.
 - Also shown is an approx equivalent on a more human scale (calculated from seconds).

Sometimes it matters

- Days and hours are always the same length (as a number of seconds).
- Months and years are not always the same length:
 - months have different numbers of days
 - years can be leap years or not
 - the actual length of 2 months depends which 2 months:

```
tribble(
    ~start, ~end,
    ymd("2020-01-15"), ymd("2020-03-15"),
    ymd("2020-07-15"), ymd("2020-09-15")
) %>% mutate(period = as.period(start %--% end)) %>%
    mutate(duration = as.duration(start %--% end))
```

```
# A tibble: 2 x 4
start end period duration
<date> <date> <Period> <Duration>
1 2020-01-15 2020-03-15 2m 0d 0H 0M 0S 5184000s (~8.57 weeks)
2 2020-07-15 2020-09-15 2m 0d 0H 0M 0S 5356800s (~8.86 weeks)
```

Comments

- ▶ Both periods are exactly two months
- but they have a different duration in seconds
- the first two-month period is shorter because it contains the short month February
- the second two-month period is longer because both July and August have 31 days.

Manchester United

Sometime in December 2019 or January 2020, I downloaded some information about the players that were then in the squad of the famous Manchester United Football (soccer) Club. We are going to use the players' ages (as given) to figure out exactly when the download happened.

```
my_url <- "http://ritsokiguess.site/datafiles/manu.csv"
read_csv(my_url) %>%
  select(name, date_of_birth, age) -> man_united
```

The data

man_united

A tibble: 29×3 date of birth name age <chr>> <chr>> <dbl> 7 November 1990 29 1 David de Gea Quintana 2 Lee Grant 27 January 1983 36 3 Sergio Germán Romero 22 February 1987 32 4 Victor Nilsson Lindelöf 25 17 July 1994 5 Eric Bertrand Bailly 12 April 1994 25 27 6 Phil Jones 21 February 1992 7 Harry Maguire 5 March 1993 26 8 Faustino Marcos Alberto Rojo 20 March 1990 29 9 Ashley Young 9 July 1985 34 18 March 1999 10 José Diogo Dalot Teixeira 20 # i 19 more rows

Ages

- ▶ A player's age is the number of *completed* years since their birth
- This suggests:
 - guessing a download date
 - working out time since birth as period
 - extracting number of years
- ▶ After that, see if our calculations of age match actual ages

Guess download date and work out ages

Guess January 10, 2020 as download date (just to pick a date):

```
guess <- ymd("2020-01-10")
man_united %>%
  mutate(dob = dmy(date_of_birth)) %>%
  mutate(age_period = as.period(dob %--% guess)) %>%
  mutate(age_years = year(age_period)) -> d
```

Results (just the ages)

d %>% select(name, age, age_years)

```
# A tibble: 29 x 3
```

	name	age	age_years
	<chr></chr>	<dbl></dbl>	<dbl></dbl>
1	David de Gea Quintana	29	29
2	Lee Grant	36	36
3	Sergio Germán Romero	32	32
4	Victor Nilsson Lindelöf	25	25
5	Eric Bertrand Bailly	25	25
6	Phil Jones	27	27
7	Harry Maguire	26	26
8	Faustino Marcos Alberto Rojo	29	29
9	Ashley Young	34	34
10	José Diogo Dalot Teixeira	20	20

[#] i 19 more rows

Which ones are different?

```
d %>% filter(age != age_years) %>%
select(name, date_of_birth, age, age_years)
```

```
# A tibble: 3 x 4

name date_of_birth age age_year
<chr> <chr> <chr> <chr> 1 Timothy Evans Fosu-Mensah 2 January 1998 21
2 Jesse Lingard 15 December 1992 26
3 Andreas Hoelgebaum Pereira 1 January 1996 23
```

- these three players were calculated wrong: we got one year too many.
- Our guessed date, January 10, was too late.
- ▶ These three players had a birthday since the actual download date
- actual download date must have been before Dec 15.

Try an earlier date

> say Dec 5:

```
guess <- ymd("2019-12-05")
man_united %>%
  mutate(dob = dmy(date_of_birth)) %>%
  mutate(age_period = as.period(dob %--% guess)) %>%
  mutate(age_years = year(age_period)) %>%
  filter(age != age_years) %>%
  select(name, date_of_birth, age, age_years) -> d2
```

Results

d2

- Dec 5 was too early for the download date
- must have been later than Dec 8 (to get McTominay's age right)
- so must have been between Dec 8 and Dec 15 (Lingard's birthday)
- Actually I downloaded the data on Dec 10.
