Tidying data: extras

Packages

library(tidyverse)

The pig feed data again

```
my_url <- "http://ritsokiguess.site/STAC32/pigs1.txt"
pigs <- read_table(my_url)
pigs</pre>
```

```
Make longer (as before)
   pigs %>% pivot_longer(-pig, names_to="feed",
                         values to="weight") -> pigs_longer
   pigs_longer
   # A tibble: 20 x 3
```

```
pig feed weight
  <dbl> <dbl> <dbl>
     1 feed1 60.8
     1 feed2 68.7
3
     1 feed3 92.6
4
     1 feed4 87.9
5
```

2 feed4

3 feed3

3 feed1

3 feed2 74

6

7

8

9

10

11

2 feed1 57

2 feed2 67.7

2 feed3 92.1

84.2

90.2

Make wider two ways 1/2

pigs_longer %>%

pivot_wider is inverse of pivot_longer:

pivot wider(names from=feed, values from=weight)

```
# A tibble: 5 x 5
    pig feed1 feed2 feed3 feed4
    <dbl>    <dbl>    <dbl>    <dbl>    <dbl>    <dbl>    <dbl>    <br/>    2    57    67.7 92.1 84.2
3    3 65 74 90.2 83.1
4 4 58.6 66.3 96.5 85.7
5 61.7 69.8 99.1 90.3
```

we are back where we started.

Make wider 2/2

Or

3 feed3 92.6 92.1 90.2 96.5 99.1 4 feed4 87.9 84.2 83.1 85.7 90.3

Disease presence and absence at two locations

Frequencies of plants observed with and without disease at two locations:

Speci	es Dise	Disease present		Disease absent			
	Location	X Location Y	Location X	$\hbox{\tt Location Y}$			
Α	44	12	38	10			
В	28	22	20	18			

This has two rows of headers, so I rewrote the data file:

Species	$present_x$	present_y	absent_x	absent_y
Α	44	12	38	10
В	28	22	20	18

Read into data frame called prevalence.

Lengthen and separate

absent y

8 B

```
prevalence %>%
 pivot_longer(-Species, names_to = "column",
             values to = "freq") %>%
 separate wider delim(column, " ",
                     names = c("disease", "location"))
# A tibble: 8 \times 4
 Species disease location freq
 <chr> <chr> <chr>
                         <dbl>
1 A present x
                           44
2 A present y
                           12
3 A absent x
                           38
4 A
         absent v
                           10
5 B
                           28
         present x
6 B
                           22
         present y
7 B
         absent x
                           20
```

Interlude

pigs_longer

```
A tibble: 20 x 3
     pig feed weight
   <dbl> <chr>
                <dbl>
1
       1 feed1 60.8
2
       1 feed2
                 68.7
3
       1 feed3 92.6
4
       1 feed4
                 87.9
5
       2 feed1
               57
6
       2 feed2
                 67.7
7
       2 feed3
                 92.1
8
       2 feed4
                 84.2
9
       3 feed1
                 65
10
                 74
       3 feed2
11
       3 feed3
                 90.2
12
       3 feed4
                 83.1
13
       4 feed1
                 58.6
```

1 4 - 10

What if summary is more than one number?

eg. quartiles:

4 feed2 69.8 5 feed3 92.1 6 feed3 96.5 7 feed4 84.2 8 feed4 87.9

```
pigs_longer %>%
  group by(feed) %>%
  summarize(r=quantile(weight, c(0.25, 0.75)))
# A tibble: 8 x 2
# Groups: feed [4]
  feed
        r
  <chr> <dbl>
1 feed1 58.6
2 feed1 61.7
3 feed2 67.7
```

this also works

7 feed4 84.2 8 feed4 87.9

```
pigs_longer %>%
  group_by(feed) %>%
  summarize(r=list(quantile(weight, c(0.25, 0.75)))) %>%
  unnest(r)
# A tibble: 8 x 2
  feed
  <chr> <dbl>
1 feed1 58.6
2 feed1 61.7
3 feed2 67.7
4 feed2 69.8
5 feed3 92.1
6 feed3 96.5
```

or, even better, use enframe:

```
quantile(pigs_longer$weight, c(0.25, 0.75))
  25% 75%
65.975 90.225
enframe(quantile(pigs_longer$weight, c(0.25, 0.75)))
# A tibble: 2 x 2
 name value
  <chr> <dbl>
1 25% 66.0
2 75% 90.2
```

A nice look

3 feed3 92.1 96.5 4 feed4 84.2 87.9

Run this one line at a time to see how it works:

```
pigs_longer %>%
  group_by(feed) %>%
  summarize(r=list(enframe(quantile(weight, c(0.25, 0.75)))
  unnest(r) %>%
  pivot wider(names from=name, values from=value)
# A tibble: 4 \times 3
  feed `25%` `75%`
  <chr> <dbl> <dbl>
1 feed1 58.6 61.7
2 feed2 67.7 69.8
```

A hairy one
