Drawing graphs

Our data

- To illustrate making graphs, we need some data.
- ▶ Data on 202 male and female athletes at the Australian Institute of Sport.
- Variables:
 - categorical: Sex of athlete, sport they play
 - quantitative: height (cm), weight (kg), lean body mass, red and white blood cell counts, haematocrit and haemoglobin (blood), ferritin concentration, body mass index, percent body fat.
- ▶ Values separated by tabs (which impacts reading in).

Packages for this section

library(tidyverse)

Reading data into R

- Use read_tsv ("tab-separated values"), like read_csv.
- ▶ Data in ais.txt:

```
my_url <- "http://ritsokiguess.site/datafiles/ais.txt"
athletes <- read_tsv(my_url)</pre>
```

The data (some)

A tibble: 202 x 13

i 1 more variable: Wt <dbl>

Types of graph

Depends on number and type of variables:

Categorical	Quantitative	Graph
1	0	bar chart
0	1	histogram
2	0	grouped bar charts
1	1	side-by-side boxplots
0	2	scatterplot
2	1	grouped boxplots
1	2	scatterplot with points identified by
		group (eg. by colour)

With more (categorical) variables, might want separate plots by groups. This is called facetting in R.
